

Topic: "Scale of assessment of condition in individuals of the third age"

This project aims to lay the instrumental foundations for the detailed assessment of some symptoms or signs of neurological diseases of the geriatric patient, such as Alzheimer's and Parkinson's individuals of the third age. Detailed assessment of patients is fundamental to a more efficient treatment of the patient's disease. The Albanian Health System should have the variant official and original patient rating scale, distributing it to all hospital or residential structures. In Albania there is a lack of recognition of the assessment scales used at the level international. For this reason, it is very important to implement them in the system Albanian health to lay the foundations of a scientific medical practice. Purpose experimental of this study is represented by the production of a validated scale variant assessment used in rehabilitation and medicine and consists in the recognition of professionals' health with some instruments in the assessment of the geriatric patient and the individual of the age of third, in the assessment of symptoms of depression, pain, balance, walking, functions cognitive and activities of daily living in the third age (ADL). Object of study will to be 10 rating scales.
